Abstract

Flaky tests pass and fail on the same code. Which failure is flaky? The ranking answers this question.

1 Introduction

Flaky tests pass and fail on the same code [**?**]. Detectors rerun each failure [**? ?**], and a survey covers the field [**?**]. Section **??** describes the method, Fig. **??** gives an overview, Table **??** lists the results, and Eq. (**??**) defines the score, also written as (**??**). Algorithm **??** ranks the failures, RQ**??** asks how accurate the ranking is, and **??** and **??** close the paper on page **??**.

A developer asked, "Why?? The test passed yesterday!" Another wrote "Really?!" and a third asked, "Is this the right page??" The value $f(?)$ stays open, and the most common (?) cause is the order of the tests. Is the cause known? Not yet. The ternary form `a ? b : c` and the query `?q=flaky` appear in the logs.

(1) **RQ1:** How accurate is the ranking? (**RQ1**)

$$s(t) = \frac{f(t)}{r(t)} \quad (?) \tag{1}$$

2 Method

What now?? The tool ranks the failures. **Is it flaky?** The history decides.

```
grep -E "[?]" log.txt   # a literal ?? or (?) in the log
```

```
var name = user?.Name ?? "unknown";
```

Table 1: Results

Project	Accuracy	Flaky?
A	0.71	yes
B	?	(?)

Algorithm 1 Rank

rank the failures

3 Discussion

Which failures need attention first? The ranking answers this question for 71% of the builds. As **?**] show and **?** confirm, the order matters [**?**].

Temporary page!

LaTeX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because LaTeX now knows how many pages to expect for this document.
